Sudbury Zoom Boom Ticket

Sudbury Zoom Boom Ticket - Zoom Boom Training focuses on correctly training potential operators on variable reach forklifts. The training objectives include gaining the understanding of the machine's physics and to be able to define the tasks of the operator. This course abides by North American safety standards for lift trucks. Zoom boom training and certification is accessible at our site or at the company's location, provided there are a minimum number of trainees. Certification given upon successfully finishing it is valid for three years.

The telehandler or telescopic handler is similar in various ways to a common forklift or a crane. This useful equipment is constructed with a telescopic boom that can lift upwards and extend forward. Various attachments could be fitted on the end of the boom, like bucket, pallet forks, muck grab or lift table. It is popular in industry and agriculture settings.

Telehandlers are most commonly used along with the fork attachment in order to transport loads. The units have the advantage that they can reach places not accessible to standard forklifts. Telehandlers can remove palletized loads from within a trailer and putting them on places which are high like for example rooftops. For certain applications, they can be a lot more efficient and practical compared to a crane.

The disadvantage of the telehandler is its unsteadiness when lifting heavier loads. As the boom extends with a load, the unit becomes ever more unsteady. Counterweights located at the back help, but don't solve the problem. When the working radius increases, the lifting capacity rapidly decreases. Various machines come together with front outriggers which extend the lifting capacity whilst the machinery is stationary.
